At DMH, precision medicine is transforming cancer diagnosis through the use of sodium fluoride NaF-18 PET/CT bone scan.

We all know early detection is key. But if you’ve already been diagnosed with cancer, early detection of cancer cells settling in your bones is extremely important.

At Decatur Memorial Hospital, we are revolutionizing the way bone cancer is detected with Sodium Fluoride NaF-18 PET/CT bone scan. This provides higher accuracy in differentiating noncancerous tumors from cancerous tumors in the bone.
